Alphabet's [GOOGL 1.21% ▲](#) Google, Microsoft [MSFT -0.98% ▼](#) and xAI have reached an agreement with the Trump administration to share early versions of their artificial-intelligence programs to assess their capabilities and security before releasing the models to the public.

The Commerce Department's Center for AI Standards and Innovation will lead evaluations of the AI programs. The center has completed more than 40 evaluations, including on models that remain unreleased. ChatGPT maker OpenAI and Anthropic reached a similar agreement with the Commerce Department in 2024.

"Independent, rigorous measurement science is essential to understanding frontier AI and its national security implications," CAISI director Chris Fall said Tuesday. "These expanded industry collaborations help us scale our work in the public interest at a critical moment."

The agreement calls for AI developers to share models with CAISI with reduced or removed safeguards to evaluate national security-related capabilities and risks.

The deal comes as the Trump administration weighs launching a new government-review process for artificial-intelligence tools that the U.S. deems to pose cybersecurity risks.

The White House is considering a cybersecurity-focused executive order that could include formalizing a government oversight group to create standards for the most powerful AI models, The Wall Street Journal reported Monday. The goal is to protect consumers and businesses from cyberattacks and other disruptions caused by the premature release of such models.

News Corp, owner of the Journal, has a commercial agreement to supply content on Google platforms and a content-licensing partnership with OpenAI.
